

basysStyle

Design your Interfaces with Maximum Flexibility

Graphic designers usually deliver their interface design as images. In contrast to that a common Qt style has to be implemented by a developer. But developers are no designers, and designers are no developers.

basysStyle offers a new way of creating styled Qt applications. Our QStyle plugin makes it possible to create a whole new look and feel for your application based on the images created by your designer. It dynamically loads pixmaps and uses it to draw your widgets. The style editor is crafted to be used by designers and allows them to deliver application styles ready to plug. This way developers can focus on implementing your application.

basysStyle

The QStyle plugin basysStyle loads and resizes pixmaps as defined in a basysStyle project file.

basysStyle Editor

The basysKom Style Editor lets you easily assign graphics to GUI elements as drawn by basysStyle. With this tool your designer can deliver ready-made style setups for immediate use.

basysWidgets

When using YGraphicButton, you assign pixmaps to use for different button states (regular, pressed, mouse over, disabled). Pixmaps can be used in a fixed-size or scale mode.

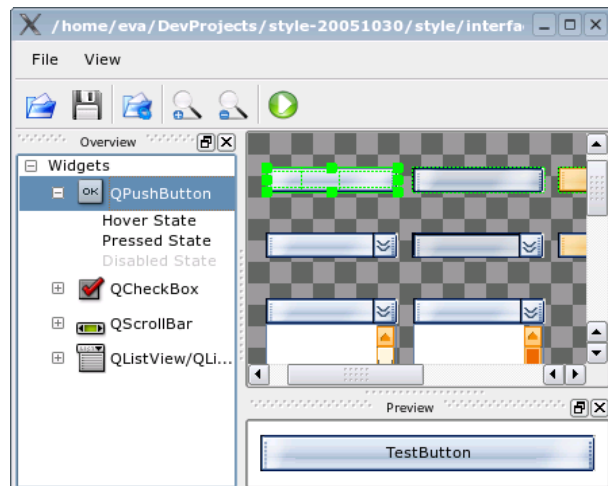

The YWebButton imitates a plain web link. It can be used for easy interfaces which would look cluttered with regular buttons.

basysWidgets are made available in Qt Designer as widget plugins.

Approx. delivery date: Q2/2006

Make your Applications Unique.
